This work is about:

- ▶ Lens (bidirectional transformation) framework
 - ***view-to-view update propagation*** [Hu+ 04, Mu+ 04]
 - A change to one view triggers changes to other views
 - ***compositional guarantee*** of ***update preservation***
 - working on ***partially-ordered update intentions***
 - hybrid of states and operations
 - finer control on update propagation
 - inspired by CRDTs [Shapiro+11, Almeida+18]

Background: Lens

[Bancilhon&Spyratos 81, Hegner 90, Foster+ 05, 07, ...]

- ▶ A pair of $get : S \rightarrow V$ and $put : S \times V \rightarrow S$

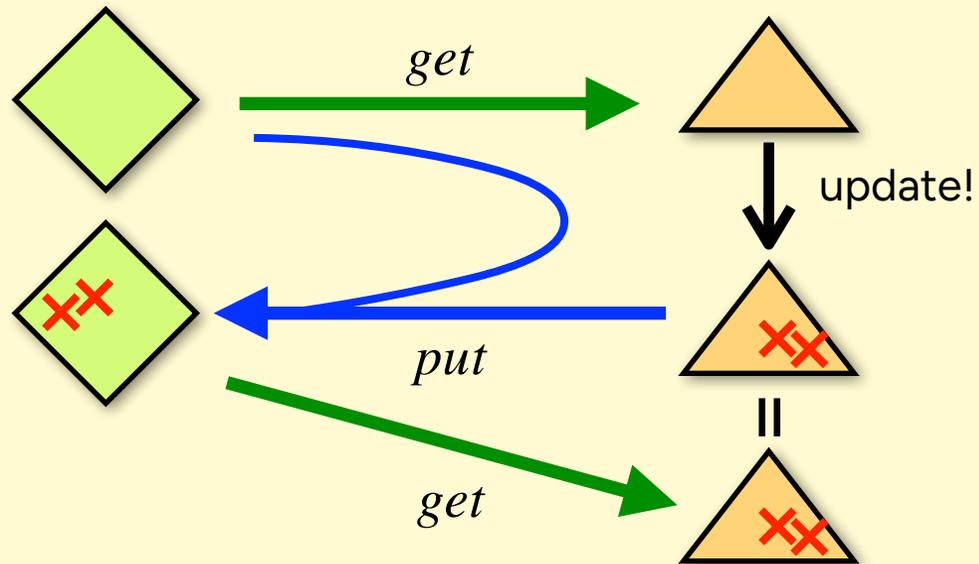

Well-Behavedness

[Bancilhon&Spyratos 81, Hegner 90, Foster+ 05, 07, ...]

Consistency (PutGet)

Today's focus

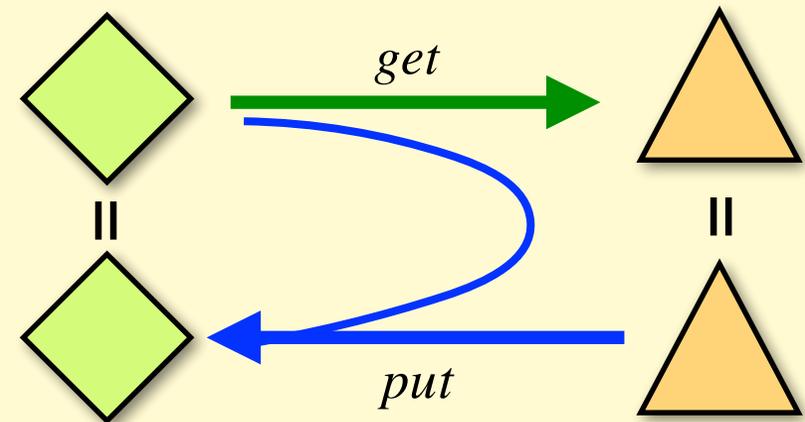

Put preserves user's update

$$put(s_0, v) = s \implies get s = v$$

Acceptability (GetPut)

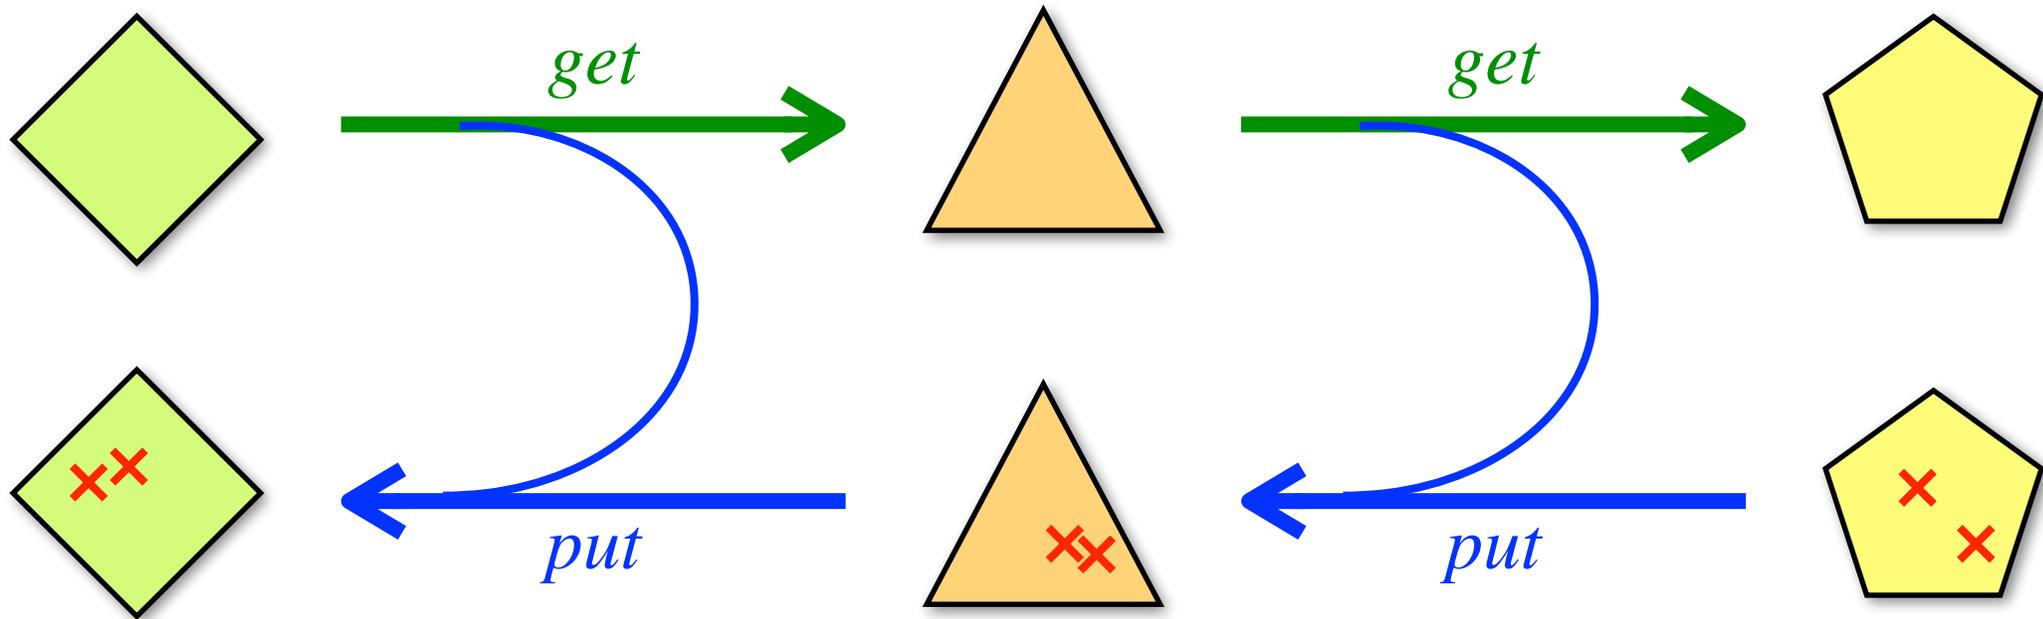

No update on the view,
no update on the source

$$get s = v \implies put(s, v) = s$$

Strength of Lens: Compositional Reasoning

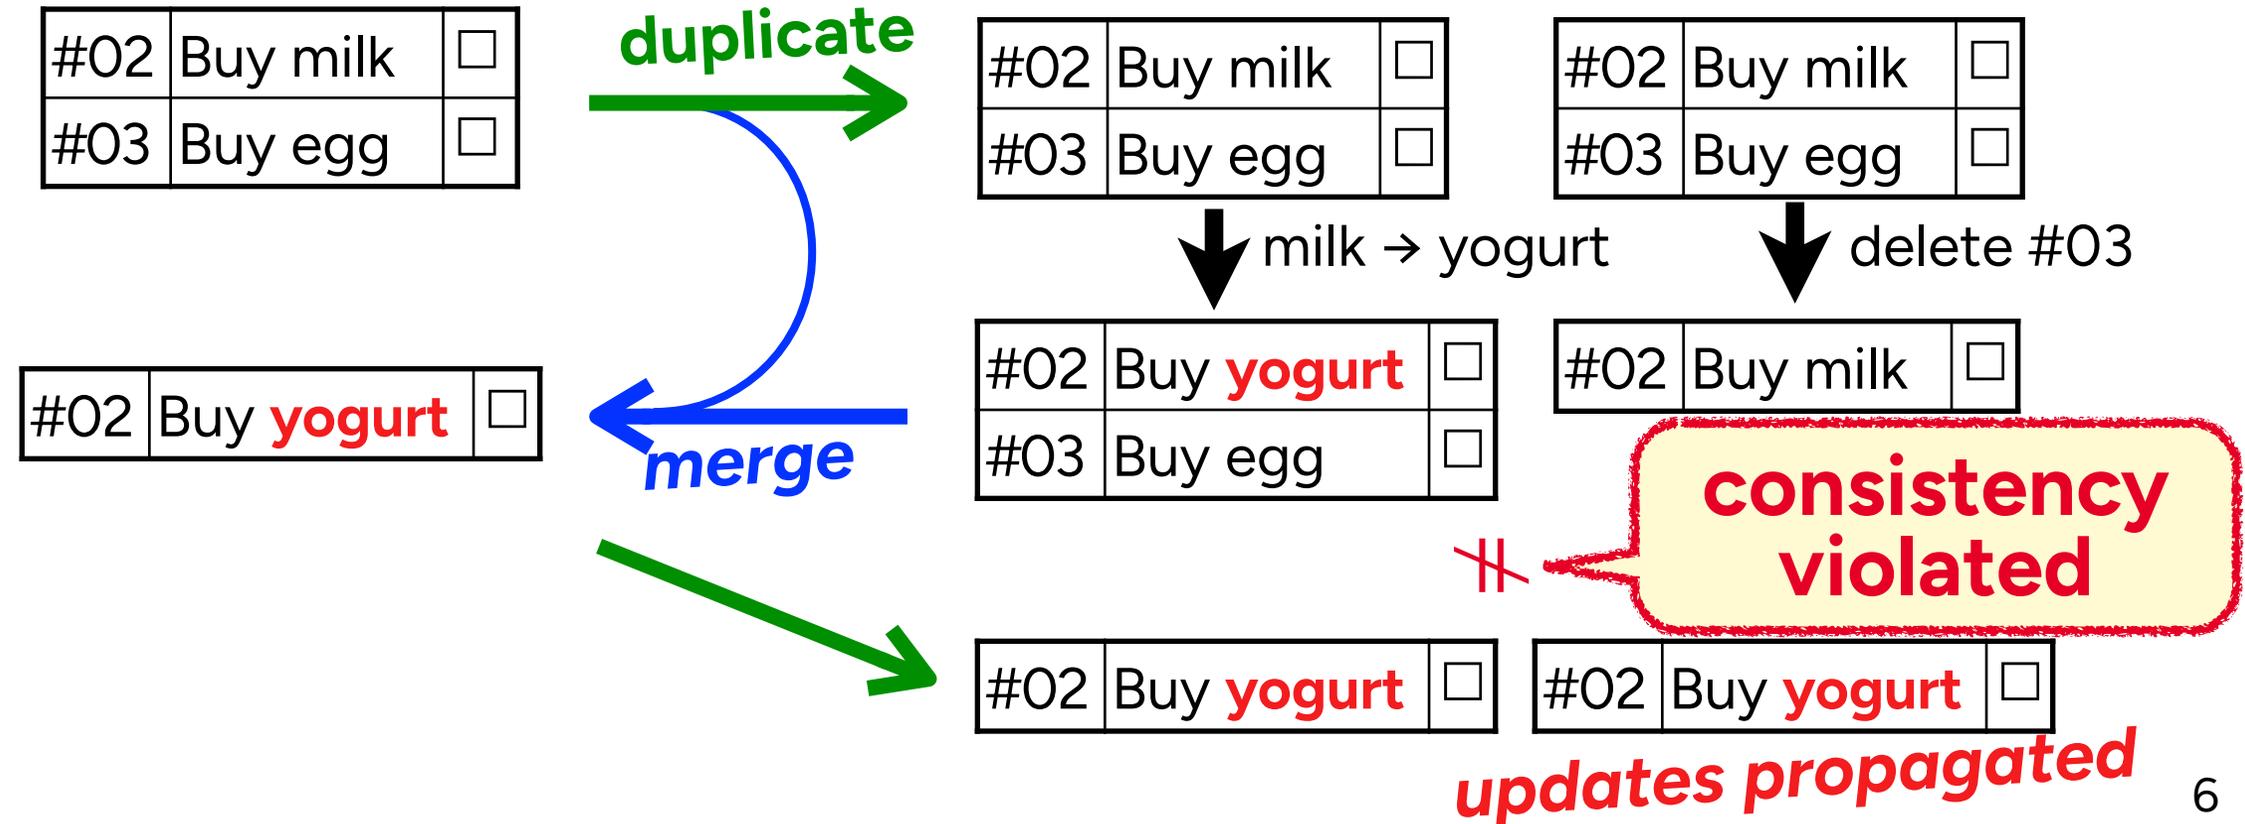

- ▶ Well-behavedness is preserved by various combinators
 - especially, lens composition
- [Foster+ 05, 07]

Issue: View-to-View Update Propagation

[Hu+ 04, Mu+ 04, ...]

- Duplication lens

Challenge: Compositional Update Preservation

- *How to state and ensure update preservation?*

compositionally

#02	Buy milk	<input type="checkbox"/>
#03	Buy egg	<input type="checkbox"/>

duplicate

#02	Buy milk	<input type="checkbox"/>
#03	Buy egg	<input type="checkbox"/>

#02	Buy milk	<input type="checkbox"/>
#03	Buy egg	<input type="checkbox"/>

↓ milk → yogurt

↓ delete #03

#02	Buy yogurt	<input type="checkbox"/>

#02	Buy yogurt	<input type="checkbox"/>
-----	-------------------	--------------------------

updates propagated

Our Approach: Partially-Ordered States

- Partially-ordered states representing *update intentions*

Existing System

Our Proposal

#02 must be kept unchanged?

-----	--	----------

\wedge

...

#02	Buy yogurt	<input type="checkbox"/>
-----	------------	--------------------------

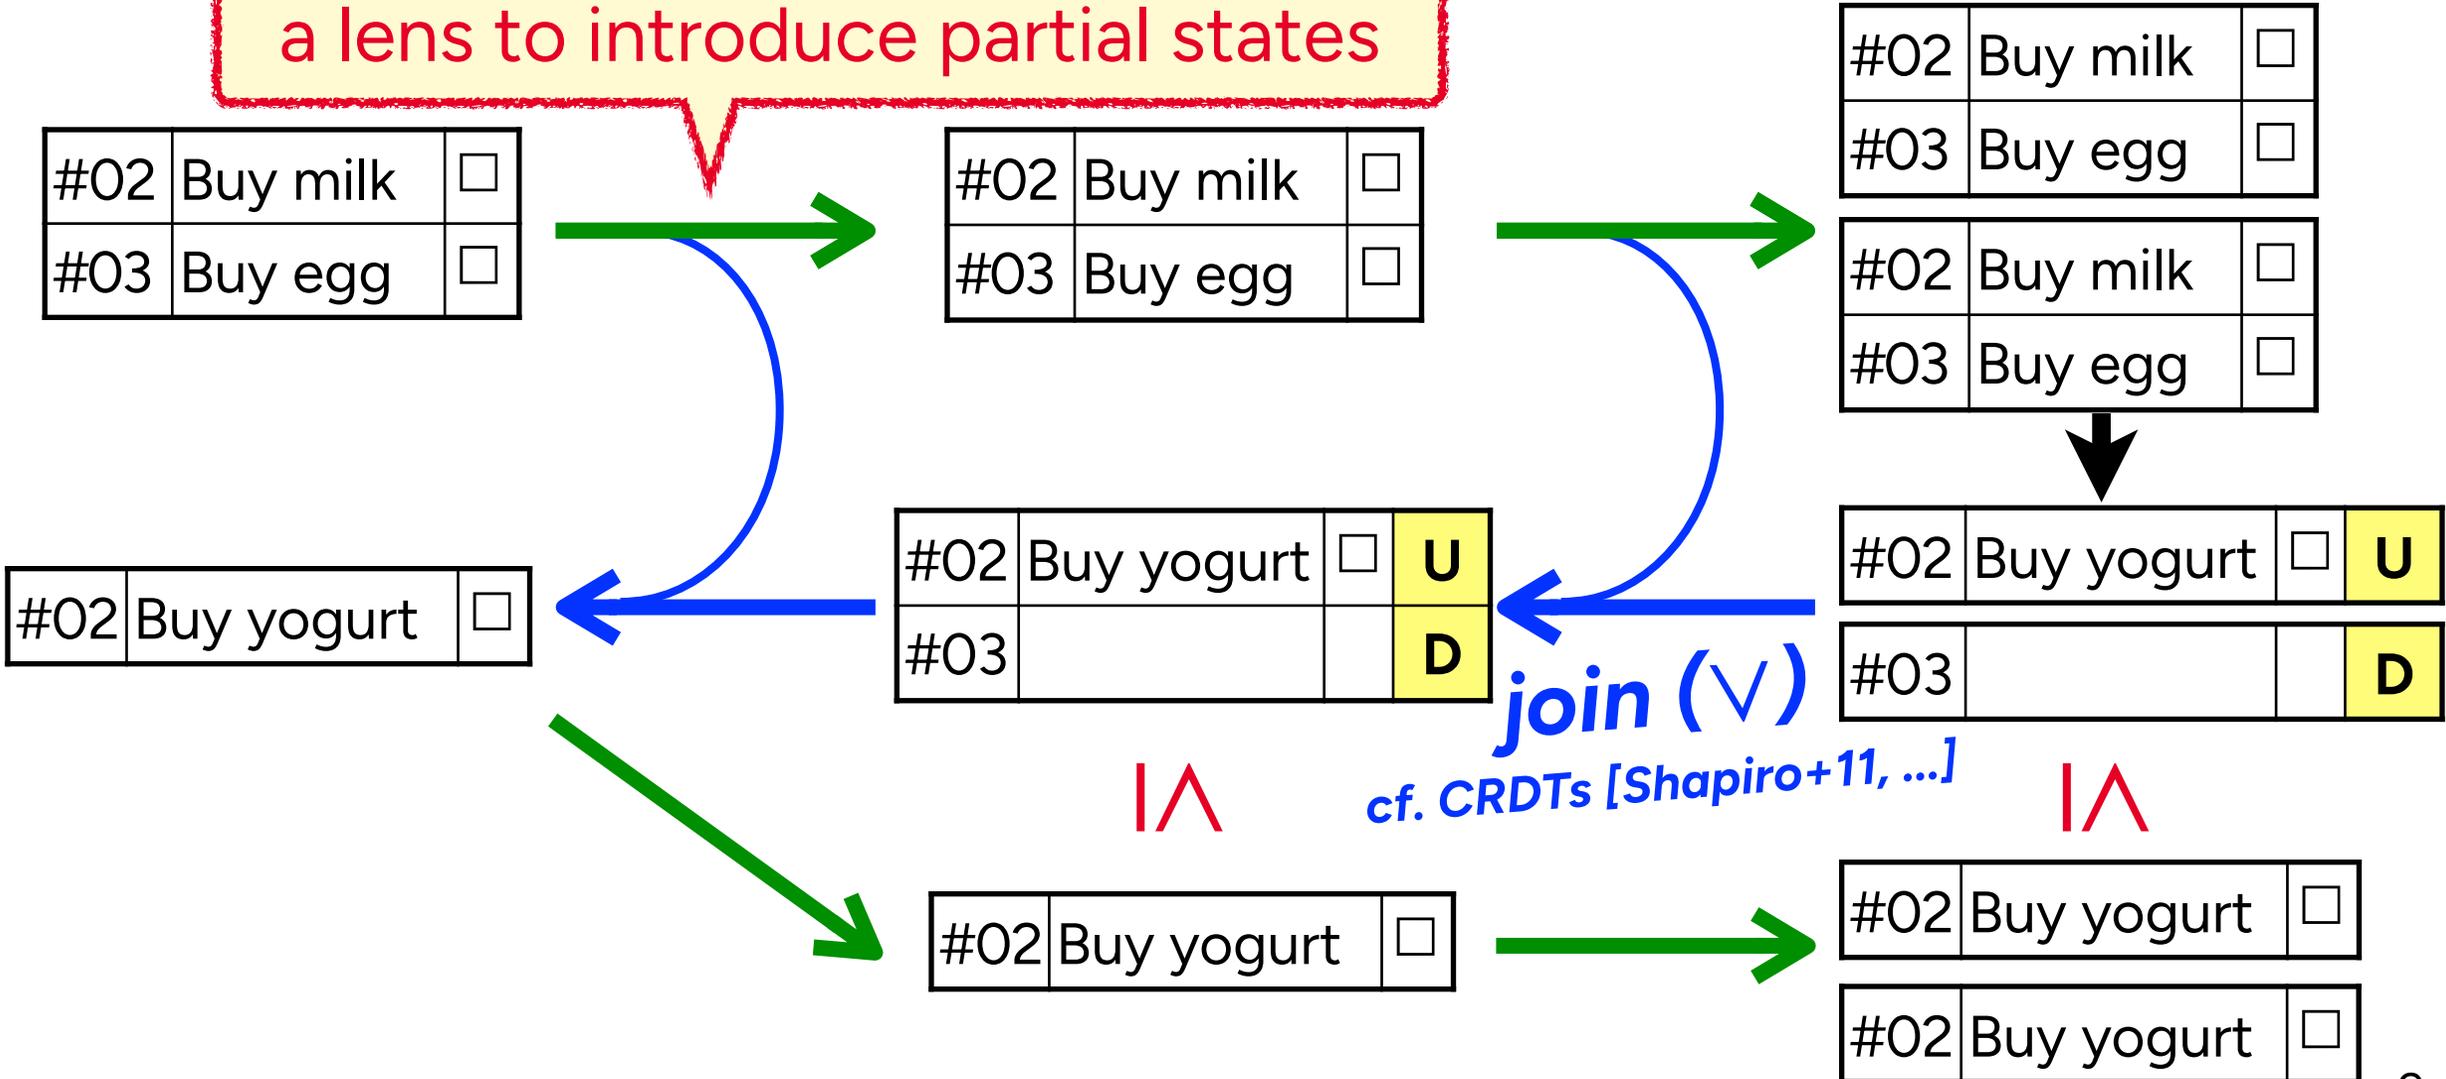

Only cares about deletion of #03

update preservation expressed by \leq

Intentions can be compared!

Merge via Join (∨)

a lens to introduce partial states

Contributions

This talk!

- ▶ ***Partial-state lenses***: Lenses for partial intentions
 - ***view-to-view update propagation via shared source***
 - ***compositional laws***, guaranteeing
 - ***update preservation***
 - synchronization after a round-trip
- ▶ An involved example demonstrating utility
- ▶ Encoding of operations as partial intentions
 - cf. edit lenses [Hofmann+ 12] and delta lenses [Diskin+ 11]

Outline

- ▶ Source and view domains
- ▶ Lawless partial-state lenses
- ▶ Our well-behavedness
 - ps-consistency (ps-PutGet)
 - ps-acceptability (ps-GetPut)
 - ps-stability (ps-PutGetPut)

Source and View Domains

▶ A poset (S, \leq) with a reflexive subset \leq_I of \leq

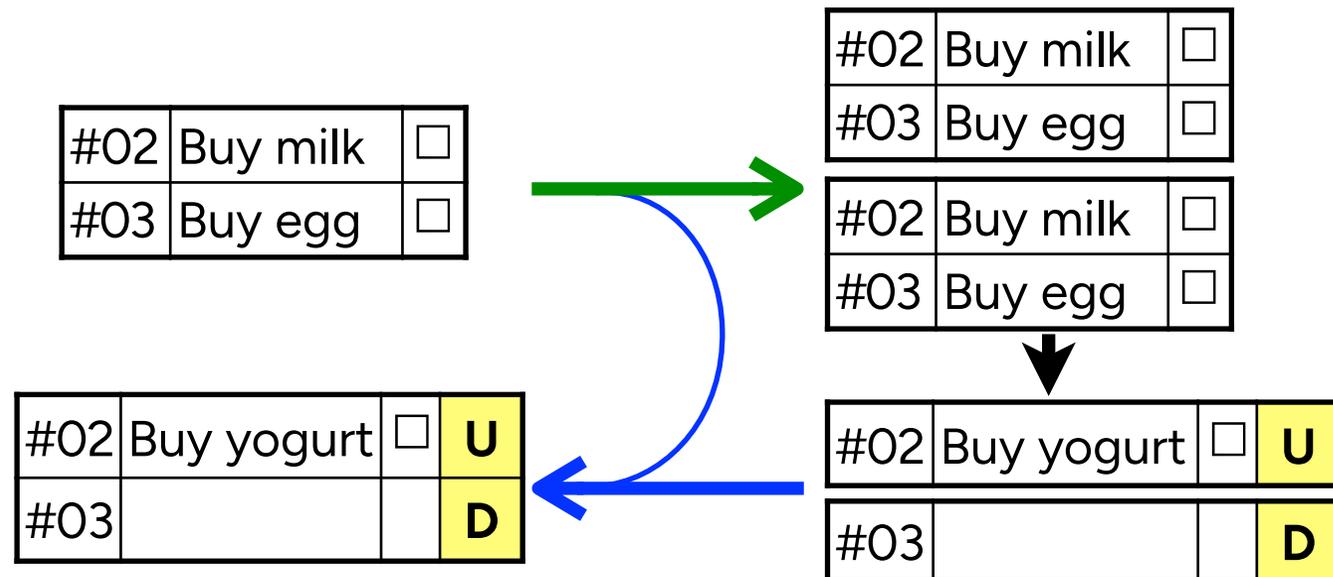

\leq restricted to “no updates”
(details omitted in this talk)

- no built-in update reflection
- no built-in distinction of “proper” states

Lawless Partial-State Lens

- ▶ A pair of $get : S \rightarrow V$ and $put : S \times V \rightarrow S$
 - no different from the original lens [Foster+ 05, 07]
 - ... except S and V are posets (with \leq_I)

Example:
duplication lens

Outline

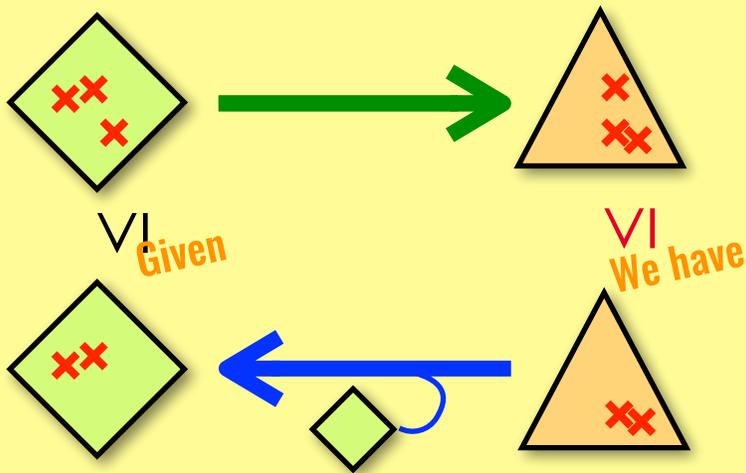

- ▶ Source and view domains
- ▶ Lawless partial-state lenses
- ▶ Our well-behavedness
 - ps-consistency (ps-PutGet)
 - ps-acceptability (ps-GetPut)
 - ps-stability (ps-PutGetPut)

Our Laws

This talk!

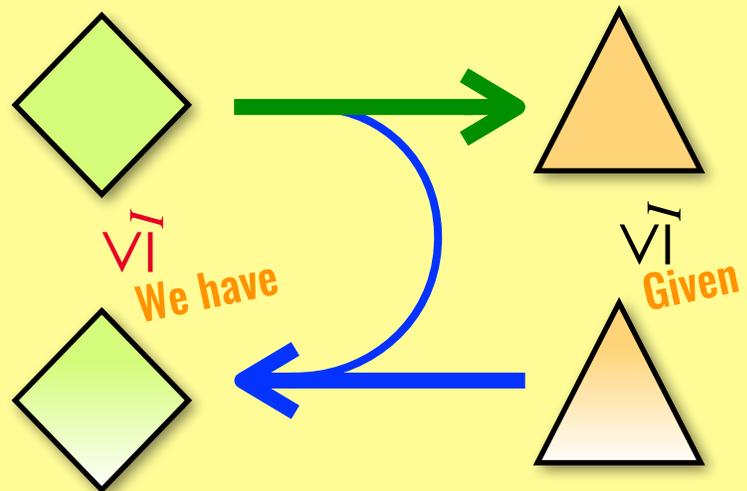

PS-Consistency

Put-then-get preserves user's update

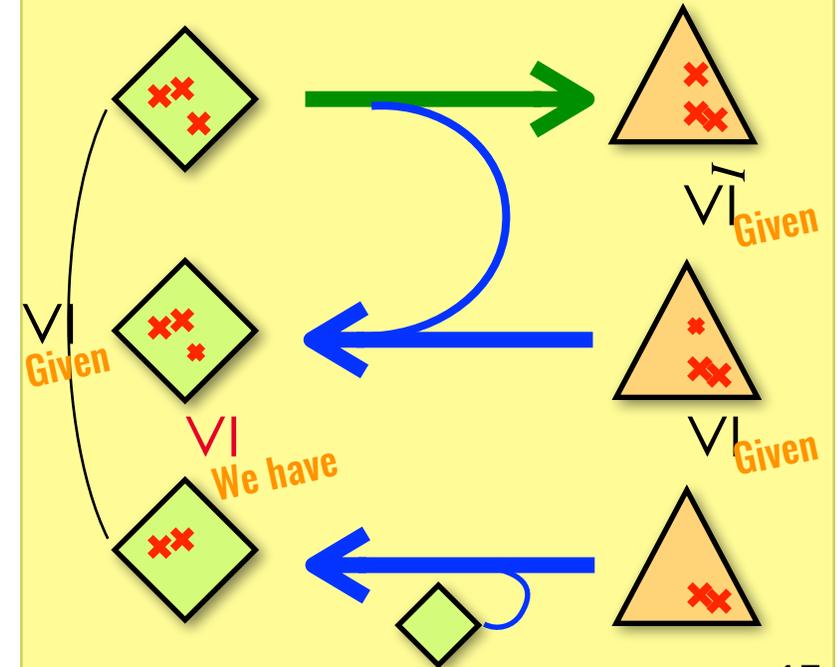

PS-Acceptability

No update on the view, no update on the source

PS-Stability

Put gives a "definite" result (put-gen-put cannot refine it)

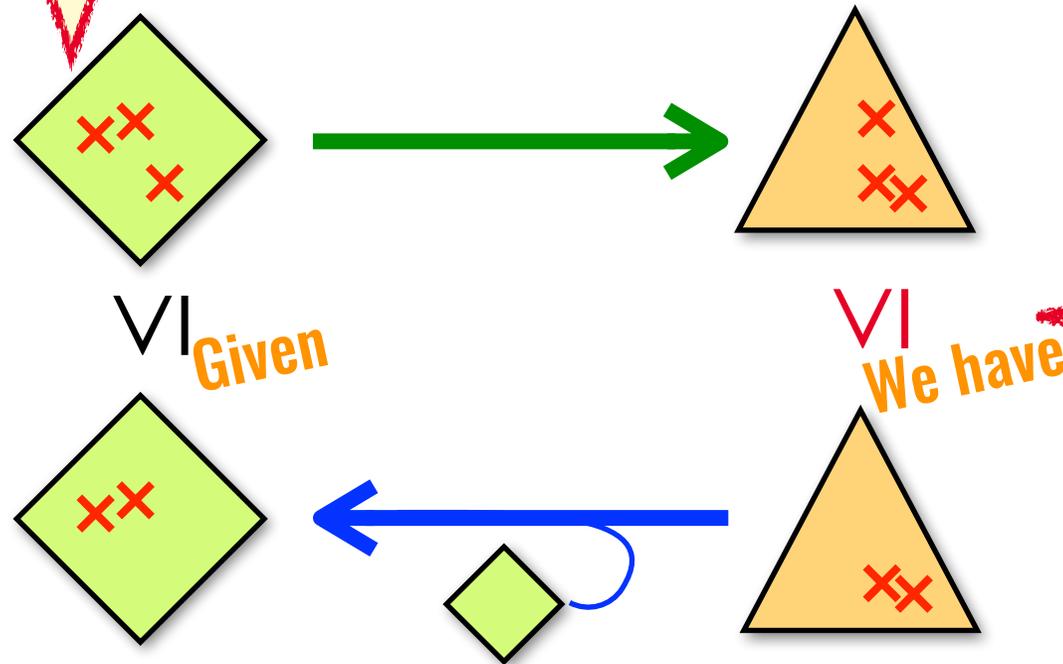

PS-Consistency

$$\frac{\text{put}(s_0, v) \leq s}{v \leq \text{get } s}$$

► Put-then-get preserves user's update

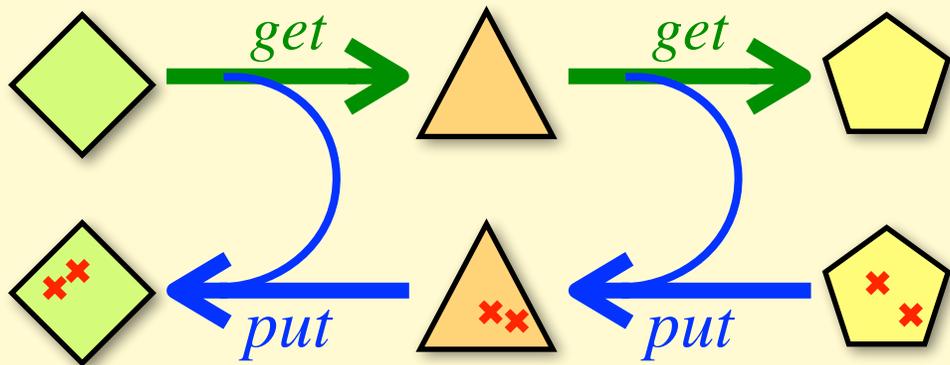

merge may introduce more updates

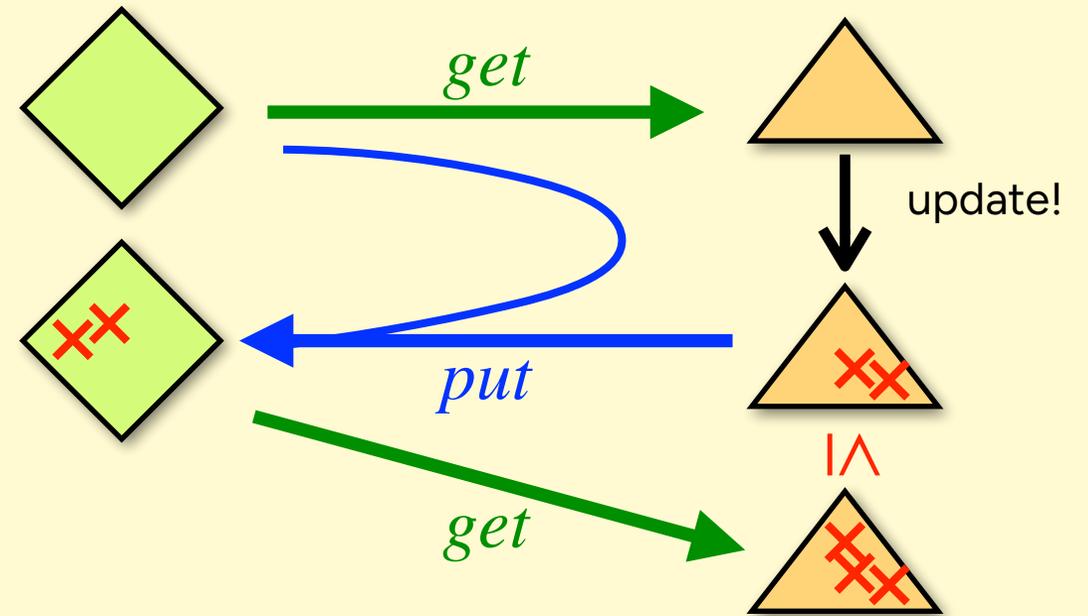

$(\leq) = (=)$ implies the original consistency (PutGet)

Theorems (See more in our paper...)

Our well-behavedness is ***closed under lens composition***

Our well-behavedness implies ***update preservation***

Related Work

- ▶ PutGetPut [Mu+ 04], WPutGet [Hidaka+ 10]
 - no compositional, no guarantee of update preservation
- ▶ \preceq -well-behavedness [M&W 18] no partial states in *get*
 - similar laws to ours, except for maximality conditions
 - limited forms of partial states and lenses
 - no view-to-view update propagation
- ▶ [Hegner 04]'s order-based laws
 - stronger than the **very** well-behavedness [Foster+ 05, 07]

Conclusion

- ▶ Lens framework, called *partial-state lenses*
 - view-to-view update propagation [Hu+ 04, Mu+ 04]
 - *compositional guarantee* of *update preservation*
 - working on *partially-ordered update intentions*
 - hybrid of states and operations
 - finer control on update propagation
 - inspired by CRDTs [Shapiro+11, Almeida+18]

Future Directions: more domains/lenses, how to input intentions
